

Convert any analog or digital signal into a DTT channel with the new DigiMod from Televes

Santiago de Compostela, June 3, 2014. Televes has launched the new DigiMod, a clever domestic modulator that allows you to convert any analog signal in A/V (Audio/Video) format, or any HDMI source into another DTT channel.

The applications are endless, as signals from sources like CCTVs, cameras, analog VCRs, DVD or Blu-ray receivers, etc. can be incorporated to all televisions in the home as another DTT channel, which will enable viewing of the content anywhere in the home.

The DigiMod modulator mixes the signal from the antenna with the additional A/V or HDMI source into a single output source onto the distribution network in buildings and homes. The device also includes a USB port that allows content to be downloaded as a video file. The output DTT signal can be configured and adjusted for optimum levels.

To make user configuration a breeze, DigiMod has a frontal LCD panel. It is a truly Plug&Play device that comes factory ready for use, only having to configure the channel number for your DTT list.
